

API and JSON Task Report

Project goal

Fetch live data from a free public API, parse the JSON response, and display the result in a clean terminal format.

API used

Open-Meteo Forecast API

Endpoint example: <https://api.open-meteo.com/v1/forecast>

Features implemented

- Uses the requests library for HTTP GET requests.
- Parses JSON with `response.json()`.
- Handles missing network access with a fallback sample payload.
- Formats the weather data for terminal output.
- Saves the raw response to `screenshots/latest_response.json`.

Project files

- `main.py` - entry point
- `api_task.py` - API and JSON handling logic
- `screenshots/api_output.png` - raw JSON screenshot
- `screenshots/project_output.png` - terminal output screenshot
- `README.md` - usage notes

Sample output

```
Weather Report
-----
City:           Bengaluru
Coordinates:    12.9716, 77.5946
Observation Time: 31 May 2026, 12:45 PM
Temperature:    29.4 C
Wind Speed:     11.2 km/h
Humidity:       58%
Weather Code:   3
Data Source:    fallback
```

How to run

```
pip install requests
python main.py
```
